

# Solutions

## Exercises 2nd Semester

## Exercise 3.1 (Authentication Bypass)

#	Username	Password	Created SQL Query	Query Result
1	horst	n0Rd4kAD3m!E	<pre>SELECT id FROM users WHERE name = 'horst' AND password = 'n0Rd4kAD3m!E'</pre>	42
2	'	qwertz	<pre>SELECT id FROM users WHERE name = '' AND password = 'qwertz'</pre>	Error
3	'--	abc123	<pre>SELECT id FROM users WHERE name = '-- AND password = 'abc123'</pre>	null

#	Username	Password	Created SQL Query	Query Result
4	horst'--	qwertz	SELECT id FROM users WHERE name = 'horst'- - AND password = 'qwertz'	42
5	admin'--	<anything>	SELECT id FROM users WHERE name = 'admin'	1
6	' OR 1=1- -	<anything>	SELECT id FROM users	1, 2, ...

## Exercise 6.1 (Info. Classification)

Practice	Public	Internal	Confidential	Secret
Publish on Internet	✓	✗	✗	✗
Publish on Intranet	✓	✓	✗	✗
Print on 	✓	✓	✓ if picked up immediately	✓ on personal or otherwise secured printer

Practice	Public	Internal	Confidential	Secret
Share with third parties	✓	✓ with NDA	✓ with NDA + permission	✓ with NDA + permission
Copy to USB key	✓	✓	✓ with encryption + permission	✓ with encryption + permission

⚠ *Many organizations do not allow the use of USB keys **in general**. This kind of restriction would obviously **overrule** any of the above "Copy to USB" assessments with ✗.*

## Exercise 6.2 (Data Lifecycle Phases)

Phase	Internal	Confidential	Secret
Permanent storage	● Access Control (against external access)	● Access Control ○ Access logs, Encryption	● Access Control, Access logs, Encryption
Transfer (internal network)	No restrictions	○ Encryption (e.g. TLS)	● Encryption (e.g. TLS) ○/● End-to-end encryption (e.g. PGP, Signal)

Phase	Internal	Confidential	Secret
Transfer (public network)	○ Encryption (e.g. VPN)	○ Encryption (e.g. VPN, TLS)	● Encryption (e.g. VPN, TLS) ○/● End-to-end encryption (e.g. PGP, Signal)
Disposal	No restrictions	● Shredding, secure deletion, data wipe	● Shredding, secure deletion, data wipe ○/● Destroy medium physically (🔨, 🔥)

**i** For "Public" data no restrictions for any lifecycle phases apply.

## Exercise 8.2 (ArrayList Deserialization)

```
/**
 * The maximum size of array to allocate.
 * Some VMs reserve some header words in an array.
 * Attempts to allocate larger arrays may result in
 * OutOfMemoryError: Requested array size exceeds VM limit
 */
private static final int MAX_ARRAY_SIZE = Integer.MAX_VALUE - 8;
```

★ Whenever an `OutOfMemoryError` occurs, the affected JVM crashes.

## Exercise 8.3 (HashSet Deserialization)

 *With its members recursively linked to each other, when deserializing `root`, the JVM will begin creating a recursive object graph. It will never complete, and consume CPU indefinitely.*

 *If you view this as a PDF, zoom in as much as possible on the above code snippet to get an idea what is going on. You might want to look at [the original Markdown](#) file to actually be able to read something.*

## Exercise 9.1 (OWASP Benchmark)
